

Tone generator and Probe are practical tools, they apply for installing network, checking object. Tone Generator emits single signal or multiple frequency signals and have two single test cartridges and test joint of 4p.

When wires are binded and hidden in the wall or be imbedded by barrier while you are using tone generator,the tone signal which is sent by main frame is very easy be tested by probe. The continuity of wire,fault of the wire,polarity of the circuit,network and work voltage of modular cable can be tested by this group tester.The pathway of circuit and detail position can be judged by pilot light and the tone of speaker.

Feature:(Tone main frame)

Choose switch of multiple frequency signal and single signal

Syllogistic remote switch applies for control operating mode

Three color pilot light,display circuit polarity,continuity and testing voltage

Red and black test cartridge,standard four wires plug

Fine moulding, expient operation

Tone Generator

Tone Probe

Tone Probe of filter function of complex information

Tone Generator & Tone Probe without filter function of complex information

Tone Generator & Tone Probe of filter function of complex information
